TABLE 1. 2-Dimensional Window Information

Req	Item	Description
1-1	CCD Identifier	This selects the CCD (out of all 10) to which the window applies.
1-2	Window Position	This specifies the window position in terms of the bottom-left pixel within the CCD's Imaging Section.
1-3	Window Width	This specifies the width of the window in terms of Imaging Section columns (1-1024).
1-4	Window Height	This specifies the height of the window in terms of Imaging Section rows (1-1024).
1-5	Sample Cycle	If processing event data, this specifies the sampling frequency of the window. If zero, no events are processed in the window. If one, then every event is processed, if 2, every other event is processed, if 3, every third, and so on. If processing raw pixel data, this specifies whether or not to send pixels who belong to the window. If zero, all pixels belonging to the window are discarded. If not zero, the pixels are telemetered.
1-6	Lower Event Amplitude and Range	When processing events, these items set the lower and upper event amplitude bounds used to select candidate events. Events whose amplitude is outside this range are rejected. When processing raw pixel data, this parameter is ignored.
